ACKNOWLEDGMENT

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Agricultural Statistics Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Farmers' Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided additional inputs needed to complete the statistical story.

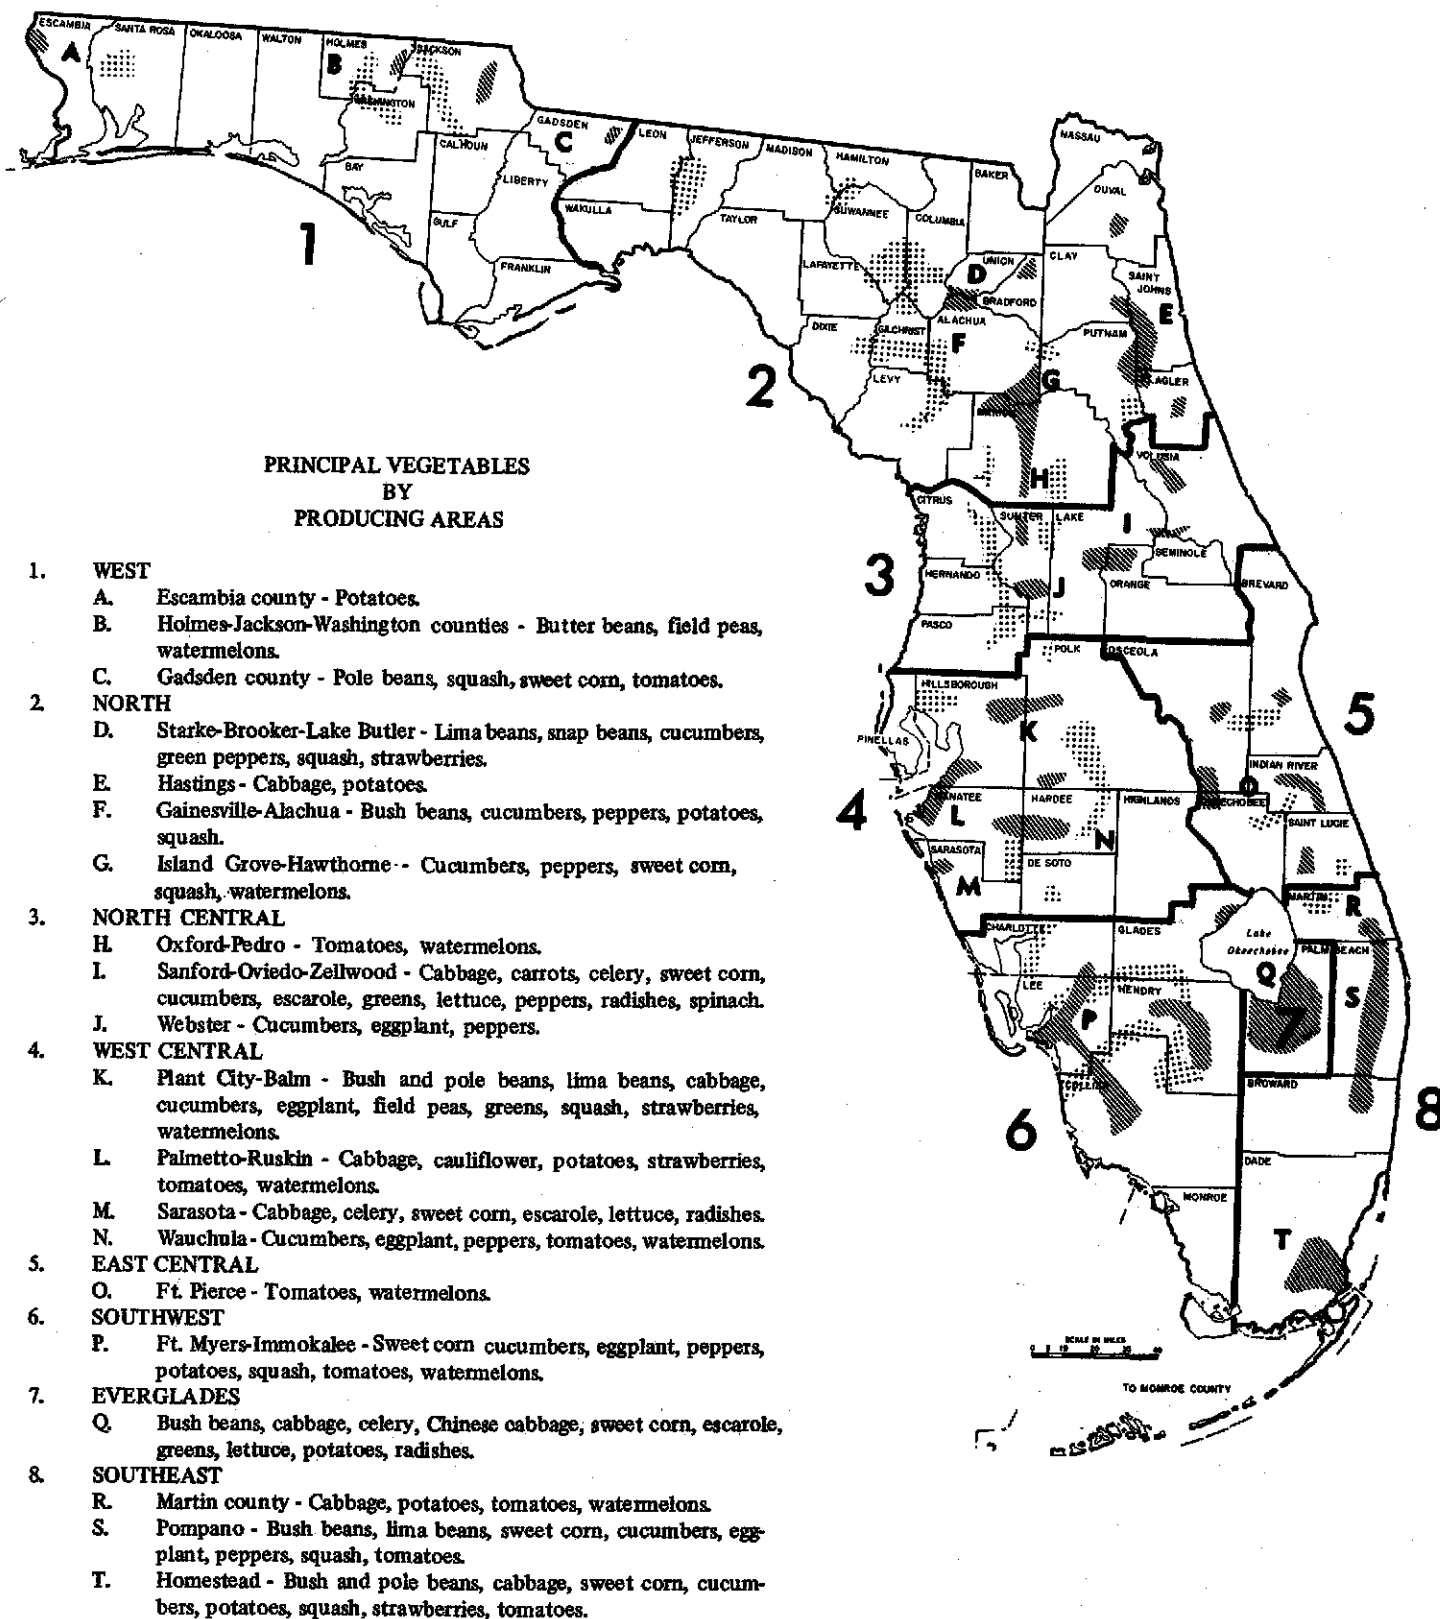

Foremost, the growers, shippers, and processors volunteered most of the basic data used in developing these statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen Larry Amlong, Palmetto; Wallace Jacobs, Jupiter; Charles Robertson, Homestead; and James Spires of Immokalee collected much of the basic acreage, production, and price statistics in this bulletin. This report was assembled under the direction of Jerry Campbell and Bill Erwin of the Florida Agricultural Statistics Service and Buck Buchanan, Market News Section. The authors also wish to thank Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Pat Quittance, Tommy Scherer, Pat Todd, and others of the Florida Agricultural Statistics Service who assisted in compiling and preparing this report.

Summary of Shipments by Crops, by Months, 1985-86	--	--	48	--

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and

other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggy-back weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight for Florida produce.

Most common unit, estimated net weight, and units per hundredweight, Florida produce, 1985-86 crop season

SUMMARY OF THE 1985-86 VEGETABLE SEASON

The farm value of Florida-grown vegetables, melons, potatoes, and strawberries sold in the 1985-86 crop year totaled \$1.2 billion, 13 percent more than the 1984-85 crop year. Crops increasing in value were snap beans, carrots, celery, eggs, escarole, lettuce, green pepper, radishes, squash, tomatoes, and watermelons. Crops with lower values than the previous year were cabbage, sweet corn, cucumbers, potatoes and strawberries. All crops which showed declines in value, had lower season average prices and with the exception of potatoes, had less production to sell. There were some rather large reductions in harvested acres from the previous year. Snap beans had the largest reduction from the previous year--\$8,730 acres. Other crops with acreage reductions included: potatoes, cabbage, sweet corn, and green peppers. Those crops with the largest gain in harvested acres were; lettuce, tomatoes, carrots, and radishes.

Average yields for snap beans, celery, eggplant, green peppers, Irish potatoes, squash, tomatoes and watermelons were higher than a year ago. Yields for cabbage, carrots, sweet corn, cucumbers, escarole, lettuce, radishes and strawberries averaged below the previous season.

Season average prices for carrots, celery, eggplant, escarole, lettuce, green peppers, radishes, squash, tomatoes and watermelons increased from the previous year. However, season average prices for all other crops were down from a year earlier.

Land preparation, planting and transplanting were active for fall vegetable crops by mid-July. Normal summer weather with hot days, warm nights and evening thunderstorms prevailed into September. Planting progressed generally on schedule. Weather during September and October continued favorable. Rainfall was limited throughout October and into November. Irrigation was necessary, at times, in all production areas.

Temperatures were generally mild during November. Hurricane Kate brought strong winds and locally heavy rainfall to the vegetable areas during Thanksgiving week. Damage was minimal. The first frost was reported in the north and central areas the third week in December.

The first hard freeze came the following week. All areas, with the exception of Dade County were affected. Damage to hardy crops and strawberries was minimal. However, there were heavy losses to cucumbers and squash in the southwest and Ft. Pierce-Stuart areas. Production was reduced on tomatoes and peppers.

Early January was characterized by mild, almost springlike temperatures. During the latter half of the month, two cold fronts passed through. The first was rather mild--some scattered frost with very little damage. The second however, was severe. Numerous crops in all areas were affected to some degree. The most notable damage was to the Everglades sweet corn crop. Much of the newly planted acreage had to be replanted. The Dade County snap bean crop also suffered extensive damage.

February, just as January did, started with some very mild weather. Rainfall was generally light with irrigation active throughout this time. Cold fronts the last of February and early March further damaged young spring crops and reduced winter crop supplies. Cold weather took one last shot at the spring crop the end of March, with freezing in the north and north central watermelon areas. Extensive replanting was required.

April and May were months of mostly warm days, and mild nights. Irrigation was active throughout the month. Crops made good progress. Harvest was underway on spring crops while declining seasonally for winter crops.

June weather was typically summer--hot days, mild nights and almost daily thunderstorms. Harvest was essentially complete for most crops, in the major producing areas, by the end of the month.

Most of the weather data for this summary were supplies through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Agricultural Statistics Service fieldmen.

SNAP BEANS
1985-86

Florida growers produced 4.1 million bushels of bush and pole beans during the 1985-86 season for fresh and processing utilization, unchanged from a year earlier. Acreage harvested for fresh and processing totaled 38,170 acres, down 19 percent from the 46,900 acres harvested during the previous season. The average yield for the 1985-86 season was 106 bushels per acre for fresh market and 133 bushels per acre for processing, as compared with 87 bushels and 100 bushels, respectively, for the previous year.

The average f.o.b. price of \$10.23 per bushel for fresh market was \$1.24 higher than the previous year. At \$3.19 per bushel, the price for processing beans was down \$1.31 from last season. Total value, at \$41.3 million, was 14 percent above last year.

Snap bean production extended from mid-October through early June. The fall crop peaked in December. Marketings then declined through February. Production began to rise in March with the spring crop peaking in April. Production during April amounted to about 17 percent of the marketings during the year--36 percent below the freeze delayed crop of a year earlier.

Heavy rains in September hampered planting in the west central and Dade County areas. However, by mid-October,

drier weather prevailed and near ideal planting and growing conditions carried into November. Strong winds, the last week of the month, resulted in some plant damage and scarring of the beans. Freezing temperatures the last week of January, throughout much of the southeastern and Dade County areas, resulted in considerable frost-burn but only a minimal amount of lost acreage. Yields were reduced somewhat. Another frost in early March did some additional damage--reducing yields and quality. Weather for the remainder of the spring season was generally favorable. Quality was generally good throughout the season. Yields were up somewhat, from a year earlier in all areas except the west.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

CABBAGE
1985-86

Florida's cabbage growers produced 5.6 million crates and bags of cabbage during the 1985-86 season. Production at this level is 28 percent less than the previous year. The gross value was \$26.7 million, a 47 percent decrease from the previous year's total of \$50.8 million. The average f.o.b. price was \$4.81 per crate or bag, down \$1.77 from the \$6.58 received for the prior season's crop. The lower average price, combined with the reduced production, accounted for the decrease in value.

Total plantings were 18,850 acres, down slightly from the 19,600 acres (largest planted acreage since 1973-74) planted during the 1984-85 season. Acreage harvested amounted to 14,400 acres. This was 14 percent less than last season. The average yield of 386 crates or bags per acre was down 77 bags from the previous season's average and the lowest since the 1969-70 crop.

Cabbage was available for market in early November and continued through June. Production during the fall months was down 21 percent from the previous fall. Production during the winter and spring period was down 28 percent from the year before. The peak months were March and April followed by February and May.

The Hastings area, which includes the three counties of Flagler, Putnam, and St. Johns, is the leading producing area in the State. This area accounted for 53 percent of the State's production during the 1985-86 season. The leading cabbage producing county is St. Johns with 4,000 acres harvested, or 28 percent of the State's total.

Transplanting got underway by mid-September. The most active period was October through December. Direct seeding in fields occurred between August and November. Only a small percentage of the total acreage planted is seeded direct in fields.

First cuttings began around mid-November. Volume increased in each succeeding month through April. Harvest then tapered off to the end of June when the last cabbage was cut in Hastings. Winter production accounted for 46 percent of the total production, slightly below the most recent 5 year average for that time period. Spring production accounted for 45 percent and the fall months, 9 percent of total production. Yields, for the fall crop, were lowered by disease problems. The winter crop was plagued by freezes and extended cold periods, which adversely affected yields.

CARROTS
1985-86

Production of carrots in Florida for fresh market and processing utilization during the 1985-86 season totaled 849 thousand cwt, down 20 percent from the previous season. Fresh use constituted 79 percent and processing 21 percent. This compares with 75 percent fresh and 25 percent processing the previous year. Approximately 18 percent of the fresh carrots were mini or finger carrots compared with 25 percent a year earlier. The remaining 82 percent were the regular type carrots.

There were 12,300 acres harvested from the 13,000 acres planted during the 1985-86 crop year. This compares with 11,500 acres harvested from the 12,500 acres planted a year earlier. Average price received for the 1985-86 crop was \$13.00 per cwt compared with \$10.30 per cwt

received the previous year. Total value was \$11.0 million, up slightly from the \$10.9 million for the 1984-85 crop year.

The muck soils around Lake Apopka, near Zellwood, and in the Everglades area south of Lake Okeechobee provided a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot harvest usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June.

Young carrots are subject to cold damage during January and February, in the Zellwood area. During the winter of 1986, there were numerous frosts and freezes in this area which adversely affected the carrot crop. While yields were below a year ago, quality and size were generally good throughout the year.

CELERY
1985-86

Florida celery marketings of 5.9 million crates were harvested from 8,500 acres during the 1985-86 growing season. The average yield of 695 crates per acre compares with 665 crates the previous year.

The season average price was almost \$1.00 higher than the previous year at \$7.36 f.o.b. per crate, compared with \$6.38 per crate during the 1984-85 season. Prices averaged higher in all months except June during the 1985-86 season when compared with the previous year.

The Everglades, with 80 percent of the harvested acreage in the State, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota and Fellsme areas, accounted for the remaining 20 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were in progress by mid-June in both major production areas. Transplanting was underway in August and became active by mid-September. Plantings in the Everglades were completed by the end of the first week in April. Plantings in the North Central area continued until near the end of April. Growers in the Sarasota area planted from October through the end of May.

Light harvest began by early November in the Zellwood and Everglades areas. Growing conditions, as is

normal, were hot and humid in the summer and early fall months. Cooler weather by November was beneficial for growth and development. The numerous winter cold spells did no significant damage.

Celery production was active from November through June with May being the peak month. Cutting was completed in all areas by the end of June.

Quality and size were mostly good throughout the season. Yields were the highest since the 1978-79 season. Approximately 10 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good size and quality celery.

Prices for the winter crop were above those of the previous year but considerably below the exceptionally good market of two years prior. Prices for the spring crop started above those of the year before but, by season's end, had fallen below the prior season's.

Celery is subject to a Federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly, and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1985-86

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by mid-November and had reached a good volume when freezing weather occurred the end of January.

Supplies during February were reduced somewhat but were recovered by March with good supplies through May. The season was over by mid-June. Quality was generally good throughout the growing season. Shipments for 1985-86 totaled 244,000 crates compared with 211,000 crates a year earlier.

SWEET CORN
1985-86

Florida, while experiencing a 5 percent decrease in production from a year earlier, continued as the Nation's leading grower of fresh market sweet corn during the 1985-86 season, producing 10.6 million crates. Harvested acres totaled 50,200 compared with 51,900 harvested the previous year. Yields averaged 211 crates per acre, down 3 crates from the previous crop year.

The season average f.o.b. price of \$5.69 per crate was 37 cents below the \$6.06 per crate average for the 1984-85 season. Sweet corn maintained its fourth place ranking in value of vegetables produced in the State and was exceeded only by tomatoes, potatoes, and green peppers.

First plantings for the fall season were underway in the Everglades and Zellwood areas in July. Seeding on the East Coast got underway in early October. Harvest began in the Zellwood area the first week of October and continued through mid-November. Harvest commenced in the Everglades at midmonth and provided the bulk of supplies through December. December supplies were supplemented by corn from the southeastern area. A frost in late December hastened the decline of the fall Everglades crop, with most growers completing harvest by early January. Harvest of the Dade County winter crop was underway by the end of December.

CUCUMBERS
1985-86

Florida's production of cucumbers for fresh market during the 1985-86 crop year totaled 5.2 million bushels, the same as for the 1984-85 crop. The 17,900 acres planted for fresh market was up 1,100 acres from the previous year. Acres harvested for fresh market totaled 16,900, up 800 acres from a year earlier. Acreage harvested for fresh market yielded an average of 310 bushels per acre, down 16 bushels from the previous season.

Total fresh market production was valued at \$35.9 million compared with \$37.4 million for the 1984-85 season. The fresh market price for 1985-86 averaged \$6.86 per bushel compared with \$7.13 the previous year and the lowest since the \$5.77 received for the 1977-78 crop.

Supplies in 1985-86 were generally available from October through June and on a more limited basis from January through March. Many of the recorded shipments moving out-of-State, during this latter time period, were from offshore and truck imports resold in mixed loads.

Monthly prices for the 1985-86 season were generally lower than prices for the 1984-85 season. Only for the months of October, November, and January, did prices exceed those of the previous year.

Cucumber acreage is well distributed across the State. The southwest area, with 36 percent of the planted acreage during 1985-86, is the largest area. The west

A cold front the first week in February brought freezing temperatures to the Everglades and Pompano areas. Growth was slowed in the Pompano area but little acreage was lost. The Everglades was not so lucky as much of the newly planted crop was killed. Replanting was extensive. Dade County continued to provide the bulk of supplies followed by the southeastern area.

A freeze the first of March, again did extensive damage in the Everglades. A very large acreage was replanted. Crops in other areas escaped with little or no damage. Dade County and the southeastern area continued to supply the winter market with good quality corn.

Harvest of the spring crop got underway in the Everglades in late April and became the main source of supply in early May as the East Coast and Dade County completed harvest for the season. Spring harvest got underway in mid-May in the Zellwood area. Volume declined seasonally in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid-July.

A small acreage provides supplemental supplies from Zellwood and the west Central area during the early fall and from Sarasota in the early spring.

central area accounted for 29 percent of the planted acres in the State. The southeast area was third with 20 percent of the planted acreage. The west and north central areas provided the remainder of the acreage.

Harvest of the fall crop commenced in the west central area by the end of September and was up to a good volume by mid-October. By late October, the Pompano crop was coming in. Fall production peaked in November as the southwest also came into production. The west central crop "picked out" in early December and volume from the other areas, then in production, declined. Supplemental supplies were provided by small acreages in the northern area.

Freezing weather the end of December, decimated the remaining crop in the southwest. Damage was minor in other areas. The Dade County crop was just coming in. Adverse weather continued to plague the crop throughout the winter.

Harvest of the spring crop was underway in the southwest by the end of March--about the same time additional acreage was coming into production in Pompano. These areas provided most of the supply through late April when the west central area started picking. Peak harvest was during April and May. Pompano and the southwest were completed by early June followed by the west central area the end of June. Harvest of the spring crop in the northern area ran through June.

EGGPLANT
1985-86

Plantings totaled 2,500 acres, down 7 percent from the 1984-85 season. Yields increased, averaging 675 bushels per acre compared with 658 bushels for the previous season. Production of eggplant fell 4 percent below last year's production to 1,586,000 bushels. However, total sales rose to \$9.1 million compared with \$7.1 million a year earlier. This increase was due to both the higher yield per acre and price per bushel which more than offset the decrease in harvested acres. The season average price of \$5.73 per bushel is \$1.43 higher than a year ago. Compared with a year earlier, prices during most of the fall and spring months were higher while the winter crop prices were lower.

Weather was generally conducive to good plant growth throughout the fall in all areas. The fall crop was harvested in good condition. A late December cold spell caused considerable damage in the Pompano area. Bloom damage was severe, which would later reduce February supplies. The crop made a good recovery over the coming weeks and planting was kept on schedule. Another cold spell, the first of February, rendered minimal damage to both the Pompano and Dade County crops. From this point through the end of the season, weather conditions were generally favorable in all growing areas.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April, reached a peak in May, and was virtually complete by July. The southeastern area around Pompano accounted for just under half of the harvested acreage. The northern and central areas combined, contributed just over one-third of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1985-86

Production of escarole and endive during the 1985-86 season totaled 2.6 million crates, down 7 percent from a year earlier. This reduction reflects a decrease in harvested acreage (from 5,700 to 5,500 acres) and a lower yield (from 500 to 480 crates per acre).

Prices during the season averaged \$5.42 per crate, compared with \$4.83 a year earlier. The total value of sales, at \$14.3 million, was 4 percent above the previous year. The Everglades, which had 69 percent of the harvested acreage in the 1985-86 season, began seeding in late August. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The planting of a small fall crop in the muckland around Zellwood got underway in late August and provided supplemental supplies throughout the fall months. Most of Zellwood's acreage was grown during

the spring and provided good volume, especially in the late spring months. The small acreage grown around the Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to a good volume by November. Marketings reached peak levels in the December through April period. Sales were complete for the season by early June.

Fall weather allowed the crop to make good progress in all areas. Quality and size were mostly good. Cold weather in late December burned some of the crop being grown in the central area. Again, a freeze the first week of February reduced supplies coming from the central area. Weather for the remainder of the year caused no major problems. Size and quality of the winter and spring crops were generally good.

LETTUCE
1985-86

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance, are: Iceberg, romaine, Boston, bibb, and leaf.

Florida lettuce growers produced 2.4 million cwt of iceberg and specialty types during the 1985-86 season--a slight increase from the previous year. The average yield of 163 cwt per acre compares with 170 cwt per acre for the previous season. Growers harvested 14,400 acres compared with 13,500 acres for 1984-85. The season average f.o.b. price for all lettuce, of \$19.13 per cwt was \$3.23 above the \$15.90 per cwt received the previous year and the highest average price since the \$25.16 received for the 1981-82 crop. Monthly prices with the exception of January and February cuttings, were above the prices of a year ago.

The Everglades muckland accounted for 85 percent of 1985-86 planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Other than the Everglades, Zellwood is the other major producing area. Sarasota and the Lake Placid mucklands contributed light supplies during much of the season.

PEPPERS
1985-86

Florida produced 11.3 million bushels of peppers during the 1985-86 season, an increase of 7 percent from the previous year and the highest production of record. The average yield of 586 bushels per acre, also a record high, was 16 percent above the 507 bushels per acre last season. Harvested acreage, at 19,200 acres, was 1,600 acres below the previous year and the lowest since the 1980-81 crop.

Total planted acreage decreased 1,600 acres from the previous season. An increase in acreage for the north central was more than offset by decreases for the north, southeast, and southwest areas. West central acreage was unchanged. The southeast accounted for 39 percent of the State's total pepper acreage. The southwest had 31 percent; the west central area, 13 percent; the north, 8 percent; and the north central area, 9 percent.

The season average f.o.b. price of \$6.83 per bushel was up from an average of \$6.59 for the previous season. However, prices were below last year except for November, December, March and April. The total value of \$76.8 million was 11 percent above the previous year. Marketings were light in October but increased to a good level by December. Supplies declined during the winter months

Seeding was underway in early September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Specialty types are grown in all production areas, while virtually all of the iceberg type is grown in the Everglades. Very light harvest of specialty types was underway by the first of November and continued light until late November. Volume gained significantly in December with growers cutting in most areas. In addition, the iceberg crop was coming into production in the Everglades. The Everglades continued to provide the bulk of the volume during the winter period. Supplies of all lettuce peaked in April, a month later than usual, and declined to the season's end by late May. Moderate supplies are available from the Zellwood area during the fall and spring; but, are rather light during the winter months.

Weather conditions from early fall through late December were favorable for good growth. A freeze in late January caused some damage in the Zellwood area to most types. Another freeze came in early February, and affected all production areas. Supplies were down, as a result, in February. A heavy volume was available from all areas during March and April. Quality was generally good throughout the season.

but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Planting got underway in early August in all production areas. From the start, disease was a constant problem that was never fully controlled in the fall crop. Spray programs were active throughout the season. Harvest was underway in the Pompano and west central areas by late October and followed a couple of weeks later by the southwest. Yields were generally below normal as a result of disease and weather problems. The fall season ended for the west central area, the end of December, just before the first freeze. Damage from this freeze was minimal--scattered bloom loss and foliage burn in Pompano and the southwest.

Freezing weather again the first week of February resulted in bloom drop and foliage burn. Some newly planted acreage in the west central area was replanted. Weather, from February on, was generally favorable. The last of the spring crop was harvested in early July, in the northern area. Yields for the winter and spring crops were improved from the fall crop.

POTATOES
1985-86

Potato production in Florida during 1986, including both winter and spring, totaled 8.5 million cwt, 8 percent more than the 1985 crop. A total of 33,400 acres were planted for harvest in 1986. Out of this total, 32,600 acres were harvested, about 7 percent less than the acreage harvested in 1985. The value of the crop was placed at \$67.6 million, down 9 percent from the previous year. This decrease is attributed to a \$1.50 decrease in the average price received for the crop. The price received for all potatoes averaged \$7.90 per cwt compared with \$9.40 in 1985.

The average yield for all potatoes was 262 cwt per acre, 36 cwt above last year. In the Hastings area, which includes Flagler, Putnam, and St. Johns counties, the average yield was 280 cwt per acre, up 35 cwt from last year. Spring potatoes grown in other areas of the State had an average yield of 190 cwt per acre, down 20 cwt from a year earlier. The winter crop averaged 210 cwt, up 45 cwt from the 1985 crop.

The "red-skinned" varieties are the dominant variety grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

The winter potato harvest was underway in late January and progressed through March and April. Winter harvest was very active in April. Harvest of the spring crop in the Hastings area got underway in mid-April with peak harvest in May. Digging continued into June and then declined sharply about midmonth. Abandonment was about normal throughout the season. Weather conditions were favorable for both winter and spring crops. Record yields were set for the Hastings area and winter crops.

SPINACH
1985-86

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetable" series shown

in this publication. Data for 1973 and earlier are available upon request. Harvested acreage for 1986 increased from a year earlier. Most of the crop is grown in the north central area.

SQUASH
1985-86

Florida's production of squash during the 1985-86 season, at 3.2 million bushels, was 13 percent above last year. The total of 15,800 acres harvested decreased 4 percent from the previous year. The yield, a record high 202 bushels per acre, was up 30 bushels from last year.

The season average price of \$12.60 per bushel, also a record high, was up \$1.60 from the 1984-85 season. Monthly prices, with the exception of March and June, were higher than the previous year. Total cash receipts amounted to \$40.2 million.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 30 percent of the State's harvested acreage in 1985-86, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the State. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous

supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1985-86 season got off to a good start. Marketings increased to a fall peak in November and early December, then declined seasonally during the winter months. A freeze in late December caused heavy damage in the southwest and Pompano areas. Dade County luckily escaped this weather. Some salvage harvest was possible in the affected areas. Another cold spell in early February further damaged the winter crop in Pompano and the southwest. Dade County also was affected. A third cold spell the first week of March damaged mature fields in the same three production areas. Scrapping was active, but yields were reduced. From this point on, the weather was generally beneficial in all production areas. Peak movement, as is usual, occurred in April.

RADISHES
1985-86

In the 1985-86 crop year, radish plantings amounted to 29,400 acres compared with 29,100 acres planted during the previous year. Acres harvested totaled 26,100, 500 acres above the 1984-85 season. Yield per acre averaged 216 cartons compared with 247 cartons a year earlier. Production totaled 5,638 thousand cartons, a decrease of 11 percent from the previous year. The crop was valued at \$21.3 million, up \$2.7 million from a year earlier. The average f.o.b. price was \$3.78 per carton, up 82 cents from the 1984-85 season.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into

June. The peak fall harvest occurred in November. The spring peak occurred in April. Seeding of the 1985-86 crop was underway in the Everglades and north central areas in early September. Early crops progressed very favorably. Light harvest was underway by mid-October and became quite active in November. In February, some acreage was lost from freezing weather. As a result, some replanting was necessary in the central area and supplies were reduced in later weeks from both production areas. Heavy rains during March, in the Everglades, caused some acreage loss. However, for the remainder of the crop year, the weather was generally favorable. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1985-86

Florida strawberry growers produced 7.6 million flats of berries during the 1985-86 season, down 14 percent from the previous year. Harvested acreage totaling 4,900 acres decreased 400 acres from a year earlier. The average yield of 1,543 flats per acre decreased 7 percent from the 1,667 flat average of a year earlier. The f.o.b. return per flat for the season was \$6.64, a decrease of 30 cents per flat from the previous season. The value of the crop was \$50.2 million, down \$11.1 million from the \$61.3 million received a year earlier.

Laying of plastic and other field work were in full swing by late September in the Hillsborough-Manatee area. Transplanting began by early October and increased rapidly for several weeks. The last fields were transplanted by early November. Light harvest was underway by mid-December in the Plant City and Dade areas. A late December freeze and also one in early February did minimal

damage as growers protected fields with sprinkler systems in both Hillsborough-Manatee and Bradford County. Plants generally recovered in good condition. Crop conditions improved through mid-March when disease and hail took their toll. Yields were reduced and by early April, many fields were open to U-Pic. Just under 45 percent of the crop was harvested in March compared to over 50 percent in the two years prior. Supplies decreased seasonally during April and ended by the last of May. Prices were lower in February and April than for the previous season but were higher for the remainder of the season.

Harvest began in Bradford County in early April and continued through May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES
1985-86

The total value of the Florida tomato crop for fresh market and processing was a record high \$458 million for the 1985-86 season, up 37 percent from the 1984-85 season. The average price received for fresh tomatoes was \$7.62 for a 25-pound carton, \$1.88 higher than the previous season and also a record high.

Total production of 61.1 million 25-pound carton equivalents was up 3 percent and a new production record for the State. Tomatoes utilized for fresh market amounted to 98 percent of the total and the remaining 2 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 39 percent of the total production and the southwest, 30 percent. Dade County had 15 percent, Ft. Pierce-Pompano, 10 percent and the remaining 6 percent was produced in the north, north central, and western areas of the State.

The average yield for fresh market tomatoes was 1,243 (25-pound) cartons, up 20 cartons from the previous year. Demand for Florida tomatoes was mostly good during the entire year. Average monthly prices held above \$5.00 for all except the last of the crop in June. The highest average monthly price of \$10.85 was received in December.

Tomato planting got underway in July in all areas except Dade County where growers started around the middle of September. Wet weather during September and October impeded planting progress and also caused disease problems that took a while to get under control. A late December freeze caused some foliage burn in all production areas but very little loss of fruit. However, a cold spell the first week of February caused some plant and fruit loss in all areas except Dade County. The last cold weather, a freakish front, froze foliage in Dade County only, the first week of March. Spring quarter weather was mostly springlike--mild days and cool nights during April, turning to hot days and mild nights by early May. Precipitation was limited during the quarter. Crops were in generally good condition throughout the spring season. Harvest was complete by the first of May in Dade County; early May in the southwest; the middle of June in Palmetto-Ruskin; and in the Gadsden County area, by the first week of July.

Fall shipments peaked in December with 11.9 percent of the total production. January was the peak month during the winter season, accounting for 11.4 percent. The spring production peaked in May with 24.2 percent of the total.

WATERMELONS
1985-86

Watermelon acreage planted during the 1985-86 season totaled 53,550 acres--a 9 percent decrease from the 1984-85 period. Of the total acres planted, 47,550 acres were harvested. This was 12 percent less than the previous season. The crop of 8.7 million cwt was 2 percent less than last season's production of 9.0 million cwt. The average yield for the State was 184 cwt per acre, up 11 percent from the previous year. The area yields varied from 130 cwt in the Panhandle to 259 cwt in the south.

The average price received was \$6.23 per cwt, up 28 cents from last season. Prices received by growers for melons were highest in the south and west central area where the harvest begins early. The total value of the crop was placed at \$54.5 million. This was 2 percent above the previous year, but 12 percent below the record high value set 2 years ago.

Some light seeding was underway by mid-December in the southwest, with planting becoming very active by early January. A cold spell the end of December burned

some leaves but otherwise did no harm. Seeding was underway in the west central area by early January and transplanting by the end of the month. Growers were not so lucky when freezing weather came the first of February. A considerable acreage was damaged badly enough in both areas, to require replanting. Frost in early March did minimal damage--mostly in the north-north central areas. The crop in the southern areas never seemed to recover fully from the adverse weather. Further, non-irrigated fields in the northern area suffered through droughty weather during much of the spring.

The watermelon harvest got underway by mid-April in the Immokalee area. The season progressed northward into the central area during May and into the northern areas in June and came to an end in the western counties by the end of July. Heaviest shipping occurred during May and June. In addition to the spring crop, there is a relatively small fall crop primarily in the Immokalee area that furnishes the market from mid-fall through the end of December.

OTHER CROPS
1985-86

Cantaloups are grown in Florida primarily in the spring and summer in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. Some cantaloups also are grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee, and Everglades areas. Harvested acreage was unchanged from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by Market News Service. In the 1985-86 season there were 81 thousand cwt (369 thousand 22-pound cartons) shipped out of the State compared with 101 thousand cwt shipped the previous season.

Tropical vegetable production during the 1985-86 season increased from the previous year primarily because of a 33 percent increase in harvested acres from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-*Ipomea batata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-*Xanthosoma caracu* or *Colocasia esculenta* (dasheen, jautia); and cassava-*Manihot esculenta* (crantz, yucca, tapioca). The boniato, Calabaza, and Malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,100 acres of tropical vegetables planted in the 1985 calendar year. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select

those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume was available from December through April. Shipments totaled 152 thousand cwt during the 1985-86 season, 37 percent more than a year earlier.

Okra is grown in many areas of the State during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other States. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other States. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the State.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from Sarasota, Lake Placid, and other areas.

Southern peas are grown primarily in the northwest, west central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-State markets show 38 thousand cwt for fresh market during the 1985-86 season.

Watercress is available the year around. The major source of supply has been the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local State farmers markets, especially the Sanford market.
